

CHAPTER – 8

JAVA FULLSTACK SUMMARY

TODAY COVERED TOPICS:-

- ✓ **ARRAY AND ITS ADVANTAGES.**
- ✓ **TYPES OF ARRAY.**
- ✓ **JAGGED ARRAY.**

ARRAY:-

- An array is a collection of elements of the same data type stored in the contiguous memory location.
- Each element is accessed using an index, starting from the (0).

SYNTAX:-

```
datatype[] arrayName=new  
datatype[size];
```

ADVANTAGES OF ARRAY:-

- Stores a multiple value of the same data type using a single variable.
- Easy to access elements using their index.
- Reduces code by avoiding many separate variables.
- Easy to process using loops(for,while,enhanced for loop).

- Useful to sorting and searching the algorithms in java.

TYPES OF ARRAY:-

ONE DIMENSION ARRAY:-

A one dimensional array stores elements in a single row.

EXAMPLE:-

```
int[] arr = {10,20,30,40,50};
```

TWO DIMENSIONAL ARRAY:-

- A two dimensional array stores data in rows and columns.
- This known as called matrix form.

EXAMPLE:-

```
Int[][]arr={  
{1,2,3},  
{4,5,6}  
};
```

JAGGED ARRAY:-

- The each and inner array can have a different length.
- Unlike a multidimensional array a jagged array does not require all rows to have the same number of columns.

EXAMPLE:-

```
int[][] jaggedArray = new int[3][];
```

```
jaggedArray[0] = new int[] { 1, 2, 3 };  
jaggedArray[1] = new int[] { 4, 5 };  
jaggedArray[2] = new int[] { 6, 7, 8, 9};
```
